		Lab	Hardison						
Antiboc	dy Name: H	3K4me3		Target: H3I	K4me3				
		Compar Source:	Abcam						
Catalog N	umber, data	base ID, laboratory	ab8580	Lot I	Number	GR22077	-1, 25644-1		
Antibody Description: Rabbit polyclonal antibody directed against a synthetic peptide conjugated to KLH derived from within residues 1 - 100 of Human Histone H3, tri methylated at K4									
Target Descriptio		H3 trimethylated or	n lysine 4						
Species Target Mouse				Species Host Rabbit					
	Validation I	Method #1 Dot Blot		Validation Me	ethod #2				
	Purification Method	Affinity		Polyclonal/ Monoclonal	Polyclona	al			
		Vendor URL:	http://www.at methyl-K4-ar	cam.com/His	stone-H3- Grade-	tri-

if your specific	ations are not	owing for antibodies listed in the drop-down ate information		tions:					
Histone Nan	ne H3	AA modified	Lysine	AA Pos	sition 4		Modification	Methylation	

Validation #1 Analysis	Dr. Brad Bernstein and his colleagues at the Broad Institute have already validated this and several other antibodies directed against specific histone modifications. They spotted synthetic peptides containing one of about 20 histone modifications on a blot, in two different concentrations. The blot was then allowed to react with the antibody, and the antigen-antibody complexes were visualized and quantified. In each case, the antibody showed strong specificity. This is far better than showing a single band on a Western blot, since all the modifications we examine are on histone H3, and they all will show the H3 band. The Western blot will not demonstrate specificity for a particular modification, whereas the dot blot does. The relevant document for H3K4me3 is http://hgwdev.cse.ucsc.edu/ENCODE/validation/antibodies/ human_H3K4me3_validation_Bernstein.pdf
	Our "validation point" for mouse is that there is nothing species-specific about the existing validations. Synthetic peptides were used on the blot, and the assay was for specific reaction with the antibody. The peptides on the blot were not species-specific because HUMAN AND MOUSE HISTONE H3 ARE IDENTICAL IN THE RELEVANT REGIONS. Human and mouse H3 differ at only one position, amino acid 97, where a Cys in human is replaced by a Ser in mouse. There are NO differences in the relevant region, which is the N-terminal 36 amino acids.
